Former guide to Nixon, Reagan and Romney predicts:

"For the first time since 1985, a Federal Ruling is about to unleash trillions of dollars..."

The last time this happened was 1985... Back then, it took just two months to create one of the greatest moneymaking opportunities in our nation's history.

Now the man dubbed "The Technology Prophet" by *Forbes* – who personally advised Ronald Reagan back in '86 – claims history is repeating itself...

the federal government has just invoked its powers to
unleash a radical new technology that will

Let me tell you the story of a little-known chapter of America's history...

On May 9th, 1985, the Federal Government made a decision that sent a shockwave through America's technology industry.

It was known as Docket 81-413.

You may never have heard of it before. Most people haven't. It's not taught in schools. It's a forgotten part of our country's history.

But without it, the modern technology industry simply wouldn't exist.

Your laptop, tablet and smartphone wouldn't work...

There'd be no video streaming on YouTube...

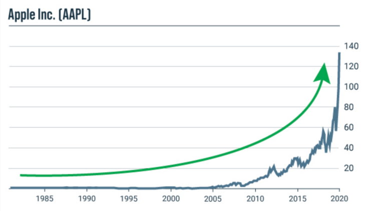
No free video calls to your grandkids on the other side of the country via Skype or Zoom...

No apps like Uber, Facebook or Spotify.

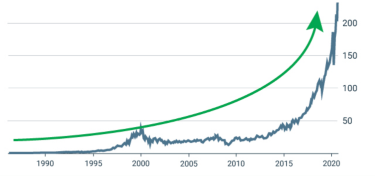
It's no exaggeration to say without Docket 81-413... every tech company you can think of...

We're talking...

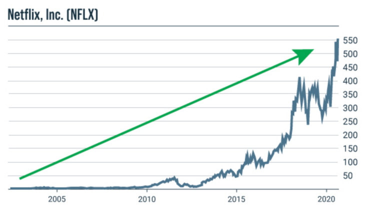
Apple's 115,800% forty-year return...



Microsoft's 199,590% thirty-four-year total return...



Netflix's eighteen year 34,340% gain...



Uber… Facebook… Google… Samsung… Intel… IBM…

None of it would exist.

Though most people have never heard of it, I'd say Docket 81-413 has probably generated more wealth for more people than anything else in modern history.

It was one of those rare moments that changed the fate of humanity – like the invention of the printing press… the radio, TV, antibiotics, fiber optics… or the creation of the first microprocessor.

These seminal moments don't come along often. But when they do, everything changes.

What made it so lucrative?

Put simply, it opened up a new way for computers, machines and other devices to communicate with each other.

See, for most of the 20th century the Federal Government maintained a tightly controlled monopoly on what it considered the "natural resources" of the radio wave spectrum.

The simplest way to understand the spectrum is to imagine a car radio…

Every station owns its own frequency on the spectrum. You just twist a dial to navigate from one to another.

Which is exactly how it works at scale – except it's not just radio, it's whole industries.

Radio stations get one part of it.

TV stations, cellphone operators, and energy companies get another.

The military… NASA… and other government agencies control huge bands of it.

This is big business. According to Politico, the prices for different slices of the spectrum ***"have become dizzying: A 2015 auction of several slices of federally controlled airwaves raised nearly $45 billion."***

For decades, the government claimed it needed to be tightly regulated by the state.

What the government was doing was effectively taking control over the communications industry, deciding who would be allowed to use the "air." And who would be barred from it.

Picking winners and losers. The winners: a few big telephone companies. The losers—American inventors of new spectrum devices.

To people who think the government should be involved 'directing' the economy… this is a great idea.

To the rest of us… it's about as dumb an idea as you'll ever hear about.

Why?

The same reason most monopolies are dumb. It stifles competition, innovation, and free enterprise.

But for most of the 20th century, no one challenged the government monopoly on the airwaves.

Until one man decided to fight the government *from the inside*…

The true story of a little-known American hero

His name was Michael Marcus.

And though you've likely never heard of him before… he should go down in history as a champion of American capitalism…

Marcus wanted to see what would happen when the government released its grip on the spectrum.

He believed the spectrum was SO valuable that it at least a part of it deserved to be open to use for entrepreneurs.

At first, it seemed like a doomed effort.

Marcus himself said that his work was ***"threatening to many people both inside and outside of the FCC."***

Of course it was. It threatened to let real competition break out!

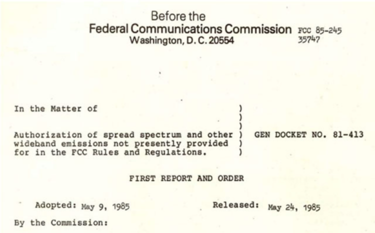
But Marcus kept at it.

And eventually… he won.

Docket 81-413 was that victory

It was the moment the Federal Government opened a tiny sliver of the spectrum up to free enterprise.

It took a tiny fraction – 2.4 GHz to be exact – OUT from its tightly controlled monopoly…



Before the
Federal Communications Commission
Washington, D. C. 20554

FCC 85-245
35747

In the Matter of)
)
)
Authorization of spread spectrum and other) GEN DOCKET NO. 81-413
wideband emissions not presently provided)
for in the FCC Rules and Regulations.)

FIRST REPORT AND ORDER

Adopted: May 9, 1985 Released: May 24, 1985

By the Commission:

And allowed "unlicensed" use on it.

In plain English, that means it allowed open source innovation on one part of the spectrum.

No one owned it.

Anyone could use it.

Marcus paid a steep personal price for that victory. As he said,

"Unfortunately the internal FCC response to May 1985 decision was not positive.

As a result there was a major reorganization of my office that seemed engineered to displace me and within 6 months of the decision I was transferred."

Yet Marcus was on the right side of history…

Because what happened next changed the world forever

How so?

Because Docket 81-413 allowed creative new tech firms to innovate the spectrum for WIRELESS communications.

In that instant, the modern world was born.

When you log on to the internet using your home router… you're using the unlicensed spectrum.

When you stream a video to your smartphone… you're using the unlicensed spectrum.

When you download or use an app… you're using the unlicensed spectrum.

Even a baby monitor or remote-controlled garage door – they all use the tiny sliver of spectrum that Docket 81-413 freed up.

It's almost impossible to put a dollar amount on just how valuable the decision was.

It's like trying to value the internet. The scale is so mind-numbingly vast that it's hard to be precise.

But for a sense of the value, just consider the industries that I think simply wouldn't have existed without Docket 81-413.

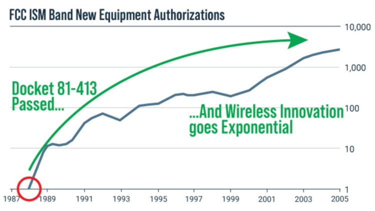
- The Wi-Fi industry… which was worth $1.96 trillion in 2018.
- The smartphone industry… worth $522 billion in 2018.
- The tablet industry… worth $258 billion per year.
- The app economy… which is estimated to be worth $6.3 trillion next year.
- And the Bluetooth industry… worth $4.5 billion.

In other words, if you take those industry figures and forecasts… the unlicensed spectrum generates roughly $9 *trillion*.

It's impossible to say how many trillions of dollars those industries have created since 1985.

And none of it would be possible without Docket 81-413

It helped usher in an incredible era of experimentation… innovation… and invention on the UNLICENSED part of the spectrum– as this chart shows.



Again – without meaning to brag – I predicted this.

In my best-selling book *Telecosm* - which was published before the first iPhones and tablets even existed – I told my readers that the spectrum would:

"*Form the core of virtually every significant modern technology – power cords and telephones; Pentium PCs; cellular phones and fiber-optic cables…*

Today most of world business in one way or another is pursuing the pot of gold at the end

of it."

And I was right.

That's EXACTLY what happened.

Put simply, if you'd understood just how valuable that decision would be back then – as I did…

You could have put yourself on the right side of one of the greatest wealth-creating trends in American history

One story I heard – a doctor called Rosario Maiolino – shows just how lucrative Docket 81-413 was…

He did something most people don't – he risked his entire life savings into a company at the heart of the new wireless industry.

Then – as wireless tech brought the internet to the masses – the stock took off.

In a single year it rose 2,619%.

In just two years, Rosario turned his $325,000 stake into $17 million.

It was enough to retire a full two decades before most people. "It was like a fairytale come true," he said.

As CNN put it, the stock involved was ***"one of the greatest get-rich-quick stocks of our era".***

Now of course, this was a highly risky move. Risking such a big portion of his life savings was something very few people would feel comfortable doing.

In this case, Rosario got his timing just right.

But Docket 81-413 sent more than one stock to the moon. Here are some of the most exceptional examples of peak gains I found.

There was Logitech – one of the first companies to create a wireless mouse for your computer. Since the 1997 IPO, it's made investors roughly 35x their money.

Motorola was another early player. It jumped as high as 20x in the next fifteen years.

So was Nokia. In twelve years between the mid 90s and mid 2000s, you could have made 20x your stake on Nokia stock.

And those were just the first wave of winners – the companies that directly used the unlicensed spectrum.

The wider implications were even greater.

Just think about the number of businesses that only exist today because of wireless internet.

Would Netflix be up 34,340% since 2000 without video streaming?

Would Cisco be up more than 500x since its IPO in 1990 without Wi-Fi?

Would Microsoft… Google… Amazon… IBM… Intel… or any of America's wealth creating machines exist without *unlicensed* wireless internet?

Probably not.

Not in anything like their current form.

You can trace the success of every single one of those stocks back to a little-known FCC decision that very few people understand today.

And here's the good news:

You're about to get a second chance

But only if you're quick.

And only if you make the handful of moves I'm going to lay out for you in the next few minutes.

As you've seen Docket 81-413 was a seminal event in American history.

Moments like that don't come around very often.

But one occurred very recently – on July 27th, 2020.

On that day the FCC opened up NEW bands of unlicensed spectrum.

One that's FOUR TIMES bigger than the spectrum liberated in 1985.

This time around it's known as Docket 18-295.

And though it's not the sort of thing that makes front page news…

It has the technology world buzzing.

Facebook's Director of Wireless called it ***"clearly one of the most important wireless announcements in a long time".***

Broadcom's Vice President of Marketing said it's ***"a definitive moment in US wireless history… the most substantive decision any Commission has made on unlicensed spectrum in almost 25 years".***

Intel called it the ***"most significant contribution to Wi-Fi in nearly 20 years".***

Apple said ***"it sets the course for the next generation of Wi-Fi networks".***

It's easy to see why…The FCC's recent decision liberates a vast amount of bandwidth from government control.

In fact, the 2.4 GHz band that the FCC opened up in 1985 had just 70 MHz of bandwidth.

Yet the recent decision opens up 1,200MHz – more than FOUR TIMES the spectrum.

It's a game-changer.

And that's where the technology hidden inside THIS device comes in…

Inside is a computer chip that was built within a month of the FCC's decision.

And it allows new technology to access – and SHARE – the 6 GHz part of the spectrum for the very first time.

If history is any guide, this may well prove to be the single most valuable technology of the 21st century.

So much so that every single major tech firm in America is backing it.

Just take a look at the companies that have joined together as part of an alliance behind it:

BROADCOM
CISCO
COMCAST
DELL
HUAWEI
intel
LG
Microsoft
NOKIA
Qualcomm
SAMSUNG
Texas Instruments
SONY

To be clear: these companies are usually direct competitors.

But in this one instance… they've teamed up.

And those giant companies are just the tip of the iceberg. Also part of this "Alliance" are:

- British Telecom
- AT&T
- Bose
- Amazon
- Facebook
- HP
- IKEA
- Logitech
- Motorola
- Softbank

- Foxconn
- General Motors
- Fujitsu
- Google
- T-Mobile
- Boeing
- Toshiba

I could go on…

But the list runs to nearly 800 major multinational corporations.

And *every single one of them* backed this move.

In other words, hundreds of multi-billion dollar companies are about to RUSH to use the new bandwidth the FCC just unlocked.

In fact, it's going to be a stampede…

First, you'll likely see new routers that are "Wi- Fi 6E enabled" appear everywhere… According to one tech analyst, these connections ***"could prove to be significantly faster than even the best that 5G has to offer".***

Suddenly, "lightspeed" internet will be everywhere…

It won't just be your home… it'll be offices, public stadiums, train stations, malls… everywhere. That's because there's now enough bandwidth for THOUSANDS of devices to share a connection.

As one analyst put it, *"If you're sitting in a packed stadium with 70,000 other people, the arrival of Wi-Fi 6E means you're not going to be competing for bandwidth in the same way you used to. It will be significantly easier to stream the event to friends, order concessions via app, or even to find out which bathroom has the shortest lines."*

This will kickstart a tech "arms race" to dominate the market…

In the next six months, every major tech firm in the world will race to get to market first.

You'll see a wave of new smartphones, laptops, tablets and other devices from Apple, Microsoft, Google and Broadcomm. Intel will have chips ready in January 2021.

Remember: there are more than 800 tech firms that lobbied for new spectrum to open up.

That means there are going to be literally hundreds (and globally, potentially thousands) of companies seeking to use the new unlicensed spectrum.

And THAT is going to create one of the greatest moneymaking opportunities of your lifetime…

These two magic words hold the key to making money from this

So how do YOU position yourself to stand a shot at profiting?

Listen very carefully to what I'm about to share with you.

Two words – just two words – hold the secret to making a killing from this.

Understand them… and what they mean for you, your family, and the rest of America… and there's a $15 trillion windfall on the table.

But without them, you'll be lost.

To explain why, I want you to imagine you're in busy public place – a mall, office or train station…

You take out your phone, laptop or tablet and search for a Wi-Fi connection.

Chances are, you'll pick up ten, twenty, even a HUNDRED different connections.

Every single one is operating on EXACTLY the same part of the spectrum.

None of those devices own their own part of the spectrum, like a radio station.

They all SHARE the same frequency.

And that’s the secret to profiting from what’s going on.

The critical technology now no longer concerns OWNING a part of the spectrum – like radio stations and TV channels do…

It’s spectrum SHARING.

Remember those two words: spectrum sharing.

They’re the key to everything.

See, your phone or router can’t simply tune in to the newly-opened spectrum.

To access this “virgin territory,” it needs special technology.

Which is sitting inside THESE devices:

The companies that make spectrum sharing possible are effectively the “gatekeepers” of the new industry.

They’re the ones that make everything else possible.

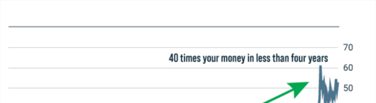
History proves… these firms were some of the best performing stocks in the world last time this happened.

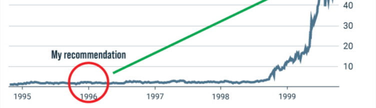
For instance, I recommended one of the world’s leading spectrum sharing tech firms in 1996…

I issued a sell recommendation four years later for a 4,234% gain.

That’s 40 times your money.

It’s one of my greatest ever picks.





And correct calls like that helped made a lot of regular folks like you a hell of a lot of money.

Many of them are still talking about it today. Just look:

I made a lot of money with George back in the late 90s. I'm hoping to do it again 20 years later.

You, and 23 others · 5 Comments

So excited for this. George has predicted some monster stocks throughout the years, I can't wait to hear what he has to say today.

Now, I don't know how much Bruce and Dave invested – or exactly how long they held the stocks I recommended.

But two things are certain.

First, they still – to this day – credit me with helping them make a fortune.

And second, right now history is repeating itself…

Now of course, I don't have a crystal ball, and past performance isn't indicative of future success.

But see, the new unlicensed band opens up **virgin territory** in the spectrum – bandwidth that has been locked away by the state.

Now it's open to everyone.

That means demand to use it is likely to go vertical….

And why you'll see every one of these boxes… in every house in America.

How much money are we talking about?

Try $15 trillion on for size.

I've run the numbers on this one. There a whole raft of new industries being propelled forward by the newly unlicensed spectrum.

In short, just as the FCC's 1985 decision paved the way for wireless, Bluetooth, smartphones, apps, and tablets…

So this year's historic decision is set to create a series of new industries…

A $15.1 trillion windfall

Here's how I think it's going to play out:

- **First, the FCC's decision is expected to create $180 billion for the American economy in the next five years.**

That number doesn't come from me, it comes from Columbia Institute's Dr. Raul Katz.

Lightning fast new broadband networks will create $106 billion… another $69 billion in new tech sales…

But that's just the first order impact of what's coming.

The second order consequences – the ones very few people ever see coming ahead of time – are projected to be vastly more lucrative.

- **It's going to send the "connected devices" market into overdrive… creating – conservatively - $1.5 trillion in new American wealth by 2030…**

The biggest trend of the 90s was the rise of personal computing, as millions of people began connecting via the internet.

Yet we're on the cusp of a bigger change… a shift that will bring BILLIONS of devices online starting next year.

Thanks to the enormous amounts of extra bandwidth in the unlicensed spectrum, a staggering THIRTY BILLION new devices will access the internet in the next two years (according to McKinsey data).

That will start with things we're already familiar with – new phones, cameras, TVs, laptops, security cameras, and the like…

But it won't end there… we'll see a wave of "wearables" like health sensors, smart clothing, and other new health devices.

Take "smart rings", for instance. They've already begun to come onto the market – providing real time health data, measuring anything from core body temperature to heart rate. The NBA has already partnered with Oura Ring to provide all players with its sleep tracking tech.

Some even connect to your bank account – as a new form of "biometric" payment system.

Not only that, according to some experts, we could see thousands of new "nanodevices" using sensors that may only be a few atoms thick…

Those devices will communicate more seamlessly than you'd ever thought possible.

That's because of something called "multi-user, multiple input, multiple output" (MU-MIMO)….

In short, right now devices have to "queue" to access your router.

So when it's busy, everything slows down – like hundreds of cars on a single lane road.

But no longer. The extra unlicensed bandwidth is like an eight lane highway – with multiple devices all communicating at once.

As the head of the Wi-Fi Alliance – which includes Apple, Facebook, Microsoft and Intel put it, ***"It's as if we have been raised in the bicycle era… and now we will get proper freeways."***

Analysts Fortune Business Insights forecast that the "connected devices" market will grow by more than five-fold in the next seven years – an exponential growth trend that will likely create multiple billion dollar companies.

- **Then you have the rise of the "smart home"… which is expected to be worth $246 billion in just a few years' time.**

You may have heard of the "smart home" before.

But so much bandwidth will enable SMART EVERYTHING.

Everything will connect to the internet via the unlicensed spectrum, from your thermostat to your fridge.

For proof of just how valuable this market will soon be, you only need look at what Apple, Amazon, Samsung, and Google have been doing recently…

At the end of 2019, they teamed up to create a shared, open source "smart home protocol" –

meaning all their home devices will soon be compatible with one another.

Siri… Google Home… Alexa… it won't matter… it'll all work seamlessly with one another.

In other words… America's biggest tech firms are joining forces in order to dominate the "smart home" market liftoff they know is just around the corner…

- **Then you have telemedicine… which Goldman Sachs believe will be worth $300 billion.**

This is another trend that has gone ballistic since the pandemic…

A few years ago, the idea of a videocall with your doctor would have sounded absurd. Not so anymore. Now, access to "remote" healthcare is taking off in a big way…

In fact, a new report by independent analysts Frost & Sullivan forecasts a "tsunami" of growth this year – with the market growing by more than 60% in 2020 alone…

…and seven-fold over the next five years.

Two big government announcements recently poured further rocket fuel on the market…

In March 2020, the U.S. Center for Medicare announced that telemedicine now qualifies at the same reimbursement rate as in-person visits –

Pushing doctors to hold more online consultations…

…and the FDA expanded its approved use list to include remote medical diagnostic devices. Many of those devices will be wireless-enabled.

And I'll bet every last cent I have they'll all use the unlicensed band.

- **Then you get to what has been described as the biggest moneymaking opportunity of all… the $13.2 trillion 5G market.**

According to the *Financial Times* 5G is *"a game changer for humanity"*.

According to *MIT Technology Review* it's *"a technological paradigm shift, akin to the shift from the typewriter to the computer"*.

And according to one industry study, it'll unleash a wave of new wealth, worth $13.2 trillion globally by 2035.

But the unlicensed spectrum is critical to this moneymaking opportunity.

What most people don't realize is, 5G traffic will mostly run through the unlicensed spectrum at 6 GHz and above. It'll share the bandwidth with your Wi-Fi and a hundred other devices.

In fact, I predict that – just as 80% of phone calls now run over Wi-Fi (unlicensed spectrum) instead of over your cell operators' licensed frequency, we'll see exactly the same thing happening with 5G.

Add those industry forecasts up and you get $15.1 trillion.

Will it create *exactly* $15.1 trillion in new wealth?

I couldn't say for sure. It could be less. It could be a lot more. That's the nature something this big. These are "best-guess" estimates from industry insiders.

But be in no doubt about one thing:

There are TRILLIONS of dollars at stake here.

Make no mistake about that.

And to be clear: none of it will be possible without **spectrum sharing** technology.

By the way, those numbers only include what we can reliably forecast will happen – because tech firms have disclosed their plans to the markets.

But behind closed doors, there are signs tech firms are gearing up to use the spectrum in ways we can't even imagine yet…

- For instance, Google recently filed reports relating to – and this is a direct quote – a ***"secret commercially valuable plan"*** involving the 6

GHz spectrum. Whatever it is, it's being tested right now in 17 different states, including California, Virginia, Florida, Iowa, and Kansas.

- Then you have Apple's recent $15 billion deal for "specific high-performance wireless components". Exactly what these components are is unclear. But rumor has it Apple will move into the Augmented Reality market in the near future.

For virtual and augmented reality to exist, it either needs a fiber connection to the internet… or huge amounts of bandwidth.

Just as phones, computers and so many other devices have gone wireless since 1985… this will likely happen to AR.

Mark my words: this is coming. And the market is forecast to double roughly every two years – starting this year.

- Then you have Amazon's plan to launch 3,200 satellites in the coming years… designed to provide broadband to thousands of square miles of the USA and the rest of the world. These satellites will operate in the licensed spectrum… while they're in the air. But those signals could easily be relayed by "Amazon Wi-Fi".

That final point isn't as far-fetched as it might seem…

With so much extra bandwidth available, Amazon, Google, and other tech giants could be planning an audacious takeover – and TAKEDOWN – of the existing cell, cable, and telecommunications networks.

It's more likely than you'd think…

I told you earlier that some of the biggest companies – including Microsoft, Apple, Amazon, Facebook, and Google – lobbied for more unlicensed spectrum.

What I didn't tell you was that *existing telecoms firms fought them tooth and claw.*

For instance, AT&T led the "counter-lobby" to keep the government monopoly on the spectrum in place. (They were joined by other "old economy" organizations like the Edison Electric Institute and the American Petroleum Institute).

Why?

Because they were scared!

Scared that – like so many other old industries – they're going to be disrupted, out-competed and replaced by NEW technology.

Mark my words…

We're on the cusp of one of the biggest shifts the tech world has seen since the mid 1980s.

I've shown you why that is today:

The last time this happened, it unleashed an estimated $9 trillion windfall…

And now – *at last…*

HISTORY IS REPEATING ITSELF!!

And that presents you with an opportunity.

Depending on your circumstances and how much you're comfortable investing… it could be a life-changing one.

The greater the risk, the greater the reward.

Hang around, and you might have to wait another 35 years for an opportunity like this.

Do you want to wait three and a half decades for another shot?

I don't.

Keep in mind: This wouldn't be the first time I've helped everyday Americans make a killing from emerging technology.

See, over the last four decades or so, I've been able to anticipate many of the world's most important innovations.

And it's likely why *Forbes* magazine had this to say about me:

> **"Gilder is pure technology… They key to Gilder's success is no mystery. He digs like a dog to learn his subject."**

Or why Microsoft founder and fourth richest man in the world Bill Gates said:

> **"Gilder is very stimulating even when I disagree with him, and most of the time I agree with him".**

Or why Rush Limbaugh had this to say of me:

> **"It would behoove you to study everything you can get your hands on by George Gilder, a true American genius."**

In many ways, I've been tracking this story my whole professional life.

That's also why one of America's great media moguls, Steve Forbes, had this to say about me:

> **"Few men or women in modern times have been so consistently farsighted in fathoming the future of high technology as George Gilder has been."**

Or why *The New York Times* called my first book *Wealth and Poverty* a "Hymn to Getting Rich".

So let me be really blunt and lay out just how big this opportunity is.

The last time anything like this happened was 1985 – and led directly to the creation of the modern tech world.

It single-handedly created scores of multi-billion dollar industries, including Wi-Fi… smartphones… apps… tablets…

And sent hundreds of stocks soaring.

Now history is repeating itself…

It's that simple.

The question is: are you in or out?

Good.

This is where the rubber meets the road.

Let's talk stocks…

How to get my report, *Three Spectrum Millionaire Makers*

You see, right now you have a small window of time to position your money in the stocks set to soar as a result of the new unlicensed band.

In January, every major router firm announced its Wifi 6E tech. That means you're going to start to see it appearing on shelves (and inside homes and businesses) very soon indeed.

That gives you – at the outside – a few weeks before this story breaks out into the open.

But don't think you can wait around until then to make your move…

You see, I've discovered that the computer chips required to tap into the new 6 GHz band are already available on the market right now.

I'm betting they're actually inside new "Wi-Fi 6E" routers already.

And they're made by a company that already supplies high end computer chips to some of the biggest companies in the world. I'm talking about:

- Apple
- Comcast
- Google
- Microsoft
- Motorola
- T-Mobile
- Sprint
- Verizon
- Ford Motors
- Tesla

In other words…

Despite the fact the 6 GHz band was only legally opened in late July…

The world's richest and most powerful companies ALREADY have access to the technology needed to access it.

That means you're likely going to see a wave of new tablets… smartphones… laptops… desktops… routers… and other devices all hit the market later this year and early next – all thanks to the newly opened spectrum.

That's why my team of researchers and I have been scouring the market for the very best ways of playing what's happening.

We've put hundreds of man-hours in…

And pinpointed the three stocks anyone who wants to profit from this needs to own immediately.

Because that's the critical point, isn't it?

It's one thing to understand what's happening (and now you do).

But if you don't position yourself to profit from what's happening, that knowledge is wasted.

That's why I'd urge you to grab a copy of a research report my team and I just put together.

It's called ***Three Spectrum Millionaire Makers.***

And in it, you'll discover three stocks that you absolutely must buy today if you want the chance to profit from the unlicensed spectrum.

It contains a full write-up on three specific businesses that I strongly recommend you consider.

- I just told you about the first company. It's is easily the world's #1 "spectrum sharing" technology firm. It had chipsets built within a month of the government even legalizing the 6 GHz band. It supplies Apple, Google, Microsoft (all trillion dollar companies), and scores of others. If firms want to roll new devices out, they'll need this company's tech.

The last time I recommended this stock, it soared more than 20x in the next four years – and it's a must own once again.

- The second stock you'll hear about is going to be central to bringing this new technology right into your home. It already supplies close to 58 million homes and businesses across America. Its network is already growing at an exponential rate – doubling roughly every 18-24 months. As Wi-Fi 6E rolls out across America it's THIS company that will likely be on the frontlines.

Chances are, this company could soon be installing its tech in your neighborhood – or even your home.

- The third stock you'll hear about just made one of the smartest acquisitions in its history. It now supplies nine of the world's top ten global internet network operators – and the top six internet content providers.

I've known one of the founders of this company for more than two decades, so this company has been on my radar for a while – and now is the time to make your move.

All three of these stocks are named in my report, ***Three Spectrum Millionaire Makers.***

I'd urge you to grab yourself a copy today.

Is this opportunity risk free?

No. Nothing in the stock market is.

Investing in new technology – and in particular smaller, more volatile companies like some of those I just mentioned – is no different.

Actually – scratch that:

Nothing in LIFE is risk free.

Anything we choose to do involves some level of risk. My advice is… have your eyes open… and only invest capital you're prepared to risk… there's no reason to take a single backward step.

I know this first hand.

As I told you earlier, I was the first person to explain to President Reagan how important the microprocessor was going to be, all the way back in the 1980s.

And I can tell you… **opportunities like this come along very rarely.**

When they do – you have to take them. (If you don't, you often end up regretting it forever.)

Nothing stings like a missed opportunity.

That's why my team of researchers and I have been scouring the market for the very best ways of playing what's happening.

And there's a simple way you can get yourself a copy today.

In fact, if you stick with me for a couple of minutes you can get your own copy of that report… alongside a whole series of special bonuses.

I'd also like to send you a copy of my latest book…

That book is a hardback copy of ***Life After Google***, my 18th book.

In this book, you'll discover the emerging technology that could destroy many of today's companies — including some of the biggest — and create brand-new ones in their place.

This book took the better part of a decade to research and write – and led me to meet personally with some of America's most successful entrepreneurs.

For instance, I talked with Vitalik Buterin, the founder of the crypto firm Ethereum.

We discussed how this new crypto architecture could eliminate lawyers, accountants, and bankers. (At least the ones who fail to get on board before it's too late.)

We also talked about how Uber, the multibillion-dollar company that displaced taxi drivers, could itself get disrupted in this new future, by a company called Swarm.

I also worked with Jules Urbach, who's collaborated with Nvidia, the microchip company that could play an enormous role in shaping the new horizon.

I went further afield too, meeting with Austin Russel, whose company is radically remaking the hardware for self-driving cars.

I sat down with Bob Mercer, who is a key figure with what's probably been the most successful investment fund in America for the last two decades.

Life After Google was a major commercial success. Check on Amazon and you'll find hundreds of five-star reviews. And a price tag of more than $15.

But today you can learn how to get a copy. I'll even pay shipping for you. Just let me know where to send it and you'll discover insights like…

- **Why AI, driverless cars, and robots that take jobs** are *not* headed where Google, Tesla, and Uber want you to think. According to everything I can find, the Valley is dead wrong about this technology. I'll show you why on page 113.

- **How one radical shift could shake our $5.1 trillion currency market** to its very core. Take a look at page 155, to see how everything you know about money could change. From how you get paid to how you buy stuff online and how you save for retirement.

- **You'll read about an investment that's averaged annual 40% returns over the last 20 years.** That's good enough that you could double your money every two years. You'll see details on page 83.
- **You'll also read about how to get in early** on over a dozen more radical companies — there are thousands lining up to play a role right now — that could lead this coming revolution. I doubt you've heard of a single one, but you can find out more starting on page 199.

Before I show you how to take advantage and claim your copy, there's something else. I'd also like to include something you can't get at *any* bookstore, online or off.

I call it ***Life After Google: The Missing Chapter***.

This is a special bonus chapter that's not in any online, or print edition.

Inside this extra chapter, you'll discover…

- Where to find the modern-day equivalent of buying America in 1970… or even 1870… **with all the wealth opportunities that even your great grandparents couldn't imagine.**
- A company rapidly moving toward world domination that's **making strides Google, Facebook, Amazon, and Apple can only dream of** — and I doubt you've heard of it.
- **How to grab a stake in all the world's most exciting technologies in just one stock** — including self-driving cars, AI, smart devices, social media, the blockchain, mobile gaming, and more.
- **The single-biggest secret behind my decades of tech-investing success**, and why it's pointing right now to shares of one of the world's most important tech companies. (I name the ticker symbol of the company in this "missing chapter".)

In just a moment I'll show you how both this extra chapter and your full hardback edition of ***Life After Google*** can be yours to keep, at no extra charge to you.

See, all three of these bonuses – my latest report ***Three Spectrum Millionaire Makers***, ***Life After Google*** and ***Life After Google: The Missing Chapter***, come free when you take a trial to my monthly newsletter ***The George Gilder Report.***

This is – to put it very simply – the culmination of my professional life's work.

As you've seen today, I've been researching, analyzing, and investing in technology for decades.

But there has never been a more critical time to understand how emerging technology will change the world than right now.

Whatever your views on the pandemic, there's no doubt it has accelerated the trends that were already rapidly reshaping America.

The shift from "real world" economy to "digital economy" has gone into overdrive…

On one hand thousands of businesses have gone under, including JC Penny, J Crew, Hertz, Cirque du Soleil, and CEC Entertainment (owner of Chuck E. Cheese). In a single month in April, 20.8 million Americans lost their jobs.

While tech firms have soared out of the crisis – in just one quarter Amazon, Apple Facebook, and Google generated $28.6 billion in profits. Tesla's stock is up 700% since the March lows.

Please understand… these trends are NOT going to reverse themselves. If anything, they'll accelerate. We're living through a critical moment in history – one that you simply cannot afford to get wrong.

And the newly unlicensed spectrum opened up just months ago is right at the heart of what's happening.

Consider… as the pandemic hit, internet traffic spiked by 30%. The working from home trend hit “warp-speed”. But it’s a bigger shift than that. It’ll be the moment historians look back on as the inflection point – when the digital economy replaced the real world economy for good.

That means internet and data use is going to continue to increase.

Vast numbers of new devices are going to connect to the internet, reshaping trillion-dollar industries of today… and creating entirely new ones that don’t even exist yet.

Put simply, if you don’t understand how technology is changing the world today… ***you’re going to find yourself on the wrong side of that change.***

And right now, technology is changing the world faster than ever

People have a right to be worried they’ll get caught on the wrong side of it.

Call it what you want. Left out. Left behind. Left in the dark. How you describe it isn’t important.

The important thing is to make sure it doesn’t happen to you and your family.

That’s why I recently created ***The George Gilder Report***.

If you want to understand the tech world…

Anticipate how it’ll change your life…

And profit from that change…

Then you should make ***The George Gilder Report*** a part of your weekly reading.

And there’s a very simple way you can do exactly that.

So here’s what I propose.

I’d like to send you every report I’ve told you about:

YOURS TODAY: ***The George Gilder Report***

If you want to learn how to make money from technology… there’s no better way of getting a head start on the rest of the market then to read my work on a regular basis. I explain the technology that could reshape the world in the near future – and show you my research and analysis on the stocks I think are profitable.

YOURS TODAY: ***Three Spectrum Millionaire Makers.***

I name the three stocks I believe are set to profit from the new unlicensed spectrum. Remember, last time this happened it took just 2 months to create one of America’s great ever stock opportunities

YOURS TODAY: A free hardback copy of ***Life After Google***

Countless people have read my book – many of them paying more than $15 to do so. You can get your own hardback copy free with this offer .

YOURS TODAY: ***Life After Google: The Missing Chapter***

This isn’t available at any price, anywhere else. It’s reserved entirely for readers of my monthly newsletter. In it, I go into detail on the biggest stock opportunity around today in a way I simply couldn’t in a hardback book.

PLUS I’ll give you immediate access to these bonuses:

BONUS #1: ***The Truth About Artificial Intelligence***

Tech elite say AI will take over the world. UBS says it could be a $180 billion industry. What’s the smart money saying? In this special report, find out why most of the experts you’re hearing from on AI are *dead wrong* about where it’s headed. Money will be made, but NOT the way they’re telling you.

BONUS #2: ***Our Robot Future***

Driverless cars, automated factories and homes that run themselves. These are all outcomes of a convergence between the “internet of things” and modern robotics and other automation technology. According to UBS, more than 70% of companies could have automated their businesses. Will your job be safe? What’s the best way to invest to stay ahead of the curve? It’s all answered here.

BONUS #3: ***The True 5G Revolution***

You've heard the hype about 5G. But maybe you don't even know what it is. In this report, get a full explanation of what it really means, how far it will spread, and the handful of stocks that could allow you to make big gains on 5G, as it rolls out over the months ahead.

BONUS #4: Immediate access to "Gilder 360." Simply put, this is what my publisher calls your chance to hear from me in person, any time I'm speaking at a conference. I've been a featured speaker many times over the years. I've even commanded a $100,000 fee for a single speech. I'll see to it you get an early-bird invitation to my next important event, wherever it takes place, with a discount whenever I can arrange it.

BONUS #5: Ask me almost anything. Every financial quarter, I'll do a special check-in with my ***Gilder Report*** readers. You'll send in your most pressing questions to my team. And we'll all log into a private online webinar where you'll get to listen in as I answer as many as possible. Of course, I can't offer you any personalized investment advice. But you'll still get the chance to add your most pressing questions about the future to our list.

I'd like you to take six months to review it all. Take a good look. Kick the tires. If you don't like what you see – no problem. I'll issue you a full, prompt refund and you can keep everything I've sent you.

And it gets even better for you: See, the regular yearly price for ***The George Gilder Report*** is $199.

But today you can get everything I just told you about, plus the next 12 issues of my newsletter, without paying anything close to that.

Why would I offer you a discount?

That's simple. I believe my work is valuable. I think it'll make you money. And I know that if you listen and get in on this opportunity then I'll likely have a reader for life. I don't want price to get in the way of that. So I'll steeply discount your subscription.

I think that's great value. But ultimately it's what you think that counts. It's entirely your call whether you give this a go or not.

But here's how I'd look at it.

A quick look at "the competition"

I've been writing about… studying… researching… and helping people make money from new technology for more than three decades.

In that time, a lot of people have tried to imitate me. (I take it as a compliment.)

You've probably experienced this yourself: they're a hundreds of newsletters out there, all promising to make you rich from new technology.

Some are good.

Others are… less so.

So how do you choose who to listen to?

Look. You're a grown up. I'm not going to tell you what to think. But if you're going to risk your hard-earned money in the stock market, I would encourage you to be sure you're hearing from people who have the right credentials.

So when you hear from "the competition", ask yourself:

Have they been in the market for at least two decades? Tech stocks have been on a tear for a decade or more. The last major tech bust was in 2001. Anyone who hasn't invested through a bear market isn't worth listening to. You learn a lot more about yourself when times get hard. I've been writing, researching, and advising presidents on technology since the late 1970s.

Is their work internationally recognized? A lot of folks like to make themselves sound important. But does anyone else read their work? My research has appeared in *Forbes, The Wall Street Journal, The Economist,* and countless other journals.

Do they have connections to tech insiders? This is crucial. You don't want to hear from a "keyboard warrior" in his basement. You want real world intelligence that can make you money. My network has reached far and wide, including everyone from the leaders of Google, PayPal billionaire Peter Thiel… to giants like Bill Gates and the late Steve Jobs, Nixon and Reagan, and Henry Kissinger.

Have they got a real track record of making people like you money? That's the crucial question. If they don't – ignore them. I made people so much money in the 1990s they're still talking about it today.

I'll be blunt: I don't think anyone else out there can match my experience… my connections… my track record… or my expertise.

But really, it's not MY opinion that counts.

It's yours.

Only you can decide whether my work will be as valuable to you as it has been to so many others.

But that's what makes this offer so valuable.

Yes, you can make a big saving on your first year of ***The George Gilder Report***, and access a whole series of bonuses right away.

But you also get six months to review everything and make your own mind up.

That puts you 100% in control of what happens next.

Maybe you missed out the last time something like this happened. This is your second shot.

But the way I see it you have two choices.

You could walk away now and never see how much you could have made.

Or – considering you can try my work for the next six months and walk away if you like – you could put me to the test, try ***The George Gilder Report*** and THEN make a decision.

When you boil it down, opportunities like this come down to one thing…

Are you the type who can see what few others can... who sides with the visionaries who move early – people like Steve Jobs, Bill Gates, and Elon Musk who move decisively and move early…

Or do you prefer to "wait and see"... to wait until something's a "sure thing" before you act?

Because the truth is, there is no such thing as a "sure thing".

Not in the tech world, anyway.

And waiting until everyone can see how big a technology is going to be means you'll likely NEVER make the kind of gains we've been discussing today.

The fact you're listening to me now tells me you're probably in the first camp – you're willing to be bold, take a risk, and get in at the same time as the other visionaries.

So just remember:

- **The last time this happened was 1985** – and some folks made a fortune. You could have made as much as 4,234% on one stock, over four years. But only if you'd moved early.
- **Now history is repeating itself…** we just saw a seminal moment in the tech world, one that will almost certainly send shockwaves through trillion-dollar industries – and create opportunities for investors to make a fortune.
- **Within the next several years this technology will be everywhere.** I bet every router, smartphone, tablet, laptop, and other device will use it. It'll be in your home. Your pocket. Your office. Potentially your car. And a million other places. It's coming, whether you invest or not.
- **Right now is your chance to position yourself to profit from what's happening.** Join me and I'll send you all the research and analysis I think you need. But I can only do so much. I've laid everything out.

Now it’s over to you.

Given everything I've shown you I can't think of a single good reason why you wouldn't join us today.

You'll get our research immediately. You can walk away with a full refund any time in the first six months and STILL keep all the reports you've received.

Opportunities like this don't come along often.

When they do, you must grab them with two hands.

I've done everything I can for you.

But I can only do so much. Now it's over to you. You have to act to grasp this opportunity.

Do that by clicking on the link this video and entering your details on our secure order form.

Best,

George Gilder
