What You Need to Know About E-Cigs

Electronic cigarettes are rapidly becoming popular as an alternative for smokers. In this day and age of electronics and gadgets, many people may see ecigs as a gimmick; but in reality, they are well-made devices that have impressed smokers far more than many ever thought they would.

The idea of an electronic cigarette was the brainchild of American inventor Herbert Gilbert. The December 1965 issue of Popular Mechanics reported that Gilbert received a patent for his "battery-operated" cigarette that could "simulate the flavor of anything from root beer to rum." Gilbert's invention never caught on, and it wasn't until 2003 when the modern electronic cigarette came into being with Hon Lik's design. Within a few years of the development of Lik's device, electronic cigarettes were on the market around the world.

Electronic cigarettes consist of three major components: battery, atomizer and liquid-filled cartridge. The battery powers the atomizer, which heats the liquid and disperses it as vapor. The battery is activated when the user inhales on the cartridge end of the ecigarette. Most ecigarettes are designed to look like tobacco cigarettes, with the battery resembling a cigarette and the cartridge resembling a filter. The atomizer is hidden inside the cartridge, or as a separate component that screws onto the battery and matches it in exterior color.

The liquid, also called eliquid or **ejuice**, contains propylene glycol, flavoring, and in most cases, nicotine. Ecigarette users can choose eliquid by flavor and level of nicotine. Eliquid with no nicotine is available, and in some cases, vegetable glycerine is used instead of propylene glycol. The glycol or glycerine makes up the majority of the formula, as it is the component that becomes vaporized by the heat of the atomizer, resulting in vapor that resembles smoke.

Many smokers who try ecigs end up preferring them to cigarettes. The advantages to ecigarettes are numerous:

Cost – Rechargeable ecigarette batteries are cost effective and make the monthly cost of ecigarettes far less than the cost of tobacco cigarettes. Most ecigarettes are sold in starter kits for upfront cost savings, with batteries, cartridges and eliquid available to be purchased as needed.

Convenience – There is no need to light an ecigarette and they produce no ash, so there's no need to carry lighters or matches, or use an ashtray.

Cleanliness – Ecigarettes produce no smoke, have no odor and do not stain hands or teeth. The vapor dissipates in the air quickly and is completely odorless, regardless of the flavor of the eliquid.

Ecigarettes are sometimes allowed in places where smoking is banned; however, this is determined by business owners, and ecigarette users should always ask before using an ecigarette in public. At home, ecigarettes keep your environment clean and odor-free.
