

## Diabetes

## How does Jeunesse Reserve help Diabetes?

1. Resveratrol have been reported to raise your body's sensitivity to insulin and that's exactly a large leap towards stopping the infection completely, simply because it reduces the volume of insulin that is required to maintain a standard amount of blood sugar.

2. Resveratrol stimulates an enzyme called "SIRT1". The SIRT1 enzyme controls the insulin sensitivity of the body and insulin secretion. When its activated it will help you fight diabetes naturally. The activation of Sirt1 gene increases the amount of mitochondria inside the bodies cells, improving their operation and boosting the bodies metabolic rate. Sirt1 also raises insulin sensitivity which facilitates the body to take in and make use of glucose from blood. Resveratrol is considered to reduce the symptoms of diabetes so it helps to fight the condition.

Mainly it improves your body's sensitivity to insulin and activates an exceptionally strong enzyme SIRT1.
