

Why Home City Ice?

We're willing to bet we've thought about ice more than you have. That's because we're passionate about making the healthiest, best tasting ice out there, and we've developed a process that produces cleaner, clearer ice than homemade. Think of our ice as bottled water in a bag!

1. Water In

Water enters the system from the source and is immediately filtered by two double carbon filters. Home City ice uses various filtration methods to ensure only pure clean water is used.

2. Water Softener

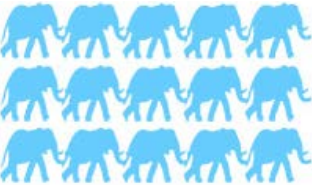

Just like in a home, the water softener replaces heavy metals such as calcium and magnesium with sodium, allowing the softened water to flow better through the pipes.

3. Purification

The water is further filtered and purified through a five micron filter, reverse osmosis, and ultraviolet purification. UV purification is used to destroy germs and bacteria in the water without the use of harsh chemicals, such as chlorine.

160 tons

On average, each one of Home City Ice's plants can produce up to 160 tons of ice a day. That's equivalent to 15 elephants. Combine all 36 production facilities and that's 5,700 tons a DAY or about 1,000 elephants!

25 miles

Almost 80% of the customers we service are within a 25 mile radius of a distribution point allowing for quick, reliable and efficient service.

36 facilities

Home City Ice operates 36 facilities across 13 states. No one facility represents more than 5% of HCI's total capacity allowing for a reliable source of supply in case of mechanical failure, power outage or water advisories.

100%

In 2012 - 2013, over 400 packaged ice production facilities were inspected by NSF certified inspectors and only 33 received perfect scores of 100%. Home City Ice was awarded 13 of the 33 perfect scores.
