Man, 71 years old

Story: A man after a stroke. In addition, he has a narrowing of the spinal canal, resulting in a loss of sensation in the left leg and sometimes a complete loss of control, as reflected by frequent falls. T. No. has been in therapy using molecular hydrogen for 2 months – the tenderness in his leg has improved significantly, the falls have stopped.

Commentary:

Stroke is a necrotizing disease of the brain – part of the brain tissue dies and the immune system then carries out a “cleansing of the terrain”, which will then either be filled by a scar or an open space will remain. The exact mechanism of action is not yet known but a higher dose of molecular hydrogen improves the status of people who have survived a stroke – as well as reducing its negative impacts. Regarding the second issue – a narrowed spinal canal pressing on the spinal cord thereby worsening the blood supply on one side and on the other the tissue is mechanically irritated resulting in the undermining of the transmission of nerve impulses (as a result reduced sensitivity is indicated). Consequently inflammation is developing which can also permanently damage the nerve structure. Molecular hydrogen can quench the inflammation and promote the blood circulation of the repressed tissue, subsequently restoring nerve function and causing the problems to disappear

Man, 67 years old

Story: In mid-October, he underwent abdominal surgery. A week after his release blood and purulent secretions appeared in the post-operative wound, accompanied by an increased temperature. After consulting with the doctor he was treated with molecular hydrogen, after five days, the wound began to heal successfully. After ten days he was completely recovered.

Commentary:

Postoperative states are associated with tissue breakdown, an overall weakening of the body (and thus susceptibility to infection) and the need for intensive healing of all that was damaged during the surgery. Molecular hydrogen is an excellent tool for the prevention of complications associated with surgical interventions. In order for its effect to be as good as possible, it's good to start at least a week before the procedure and proceed immediately after awakening, for at least as long as needed to heal the surgical wounds and damage associated with the surgery to the body.

Story: woman, 40 years old

The woman suffered from thyroid cancer she was operated on – the entire gland was removed. She was then treated with replacement therapy, which caused side effects such as tremors, crying spells, loss of appetite, headache, and weakness in the legs. After treatment with therapy using molecular hydrogen these problems were resolved within a few days. As a “bonus” after a month and a half of use she visibly lost weight on her legs, her cellulite disappeared, her skin improved and her wrinkles diminished.

Story: woman, 30 years old

In January 2013 the initiation of treatment of hypothyroidism – Euthyrox 75 After this medication weight gain of about 5 kg. Immense fatigue, insomnia, headaches, joint pain. In August 2013 the beginning of the use of molecular hydrogen, then a very significant improvement in health status, a huge increase physical and mental energy, and weight loss of 4 kg. She currently continues to use a maintenance dose.

Commentary:

Replacement therapy of thyroid hormones may be very challenging in their manifestations. The body normally produces the exact amount of hormones it needs, while tablets regularly deliver a certain amount. It's unnatural rhythm of the hormonal load. Moreover, in a terrain where the body had to deal with the consequences of a cancer and surgery, the consequences can occur with even greater force. Molecular hydrogen helps to get rid of substances excluded by tumour metabolism and as a result of operations. It also increases the body's ability to cope with stress, which occurs as a result of taking the medication. With the woman tone, a decrease in wrinkles and cellulite.

Man, 35 years old

From May 2013 he used molecular hydrogen at first for a month at elevated doses, after at a maintenance level. His hay fever (allergic reaction to pollen) disappeared and he stopped taking antihistamines. As a person who enjoys sports (running, walking) during 9 months he lost almost 23 kg.

Male, age not available, sent from the UK

“I started using molecular hydrogen in September 2013, when I was preparing for the triathlon season. As a person who is trained and who has competed in sports for decades, I was not expecting any great results. However, I was shocked – during the nine-month training I very rarely had aching muscles or accumulated lactic acid in training or in competitions. Also after an hour of training when a person normally starts to use ‘deep’ reserves’, on the contrary, I caught a second wind and was able to work even harder. My progress this season was incredible. I haven't seen anything like it during the last 18 years.”

Commentary:

Molecular hydrogen is very useful for athletes as it quickly promotes a fast flushing of especially lactic acid from the muscles, but also other metabolites resulting from increased physical activity. Besides this also an improving of the rheological properties of blood and red blood cells together with oxygen, vitamins and other nutrients occurs, better reaching each cell. Consequently, the cells and tissues are well cleansed and nourished and regenerate quickly. Athletes have a much higher performance.

Woman, 40 years old

She was given molecular hydrogen in the terminal phase of cancer. She suffered from weakness, loss of appetite, severe side effects of cancer treatments. After consulting with a competent physician, she began to use molecular hydrogen at very high doses, together with a strict diet. After a week her personal comfort increased so much that she was able to move freely, she started eating a normal diet, the other side effects of the therapy also partly subsided.

Commentary:

Molecular hydrogen has very strong detoxifying effects. The cause of symptoms in cancer patients are tumor-secreted metabolites. These are various waste products, hormones, acids (including lactate), etc. Consequently the body is strongly hyperacidic (therefore here together with hydrogen an alkaline strict diet is very helpful) and on the other hand it has to manage the onslaught of a large amount of "foreign waste". Anticancer therapies increase this effect since they induce cell death in a variety of tissues (other waste extra) and reduce the body's natural ability to clean and resist. After the deployment of the vigorous hydrogen treatment the results in the form of improved general condition and personal comfort are therefore very fast and powerful.

Woman, age not specified

Story: 14 years of bronchial asthma attacks and severe cough. After a week of use of molecular hydrogen the seizures stopped. The therapy has gone on for four months without any problems.

Commentary:

Molecular hydrogen has already proven itself in practice in several cases of bronchial asthma in people around me. All have repeatedly undergone control in the lung department with improved results, even with lower doses of drugs. Molecular hydrogen interferes with the pathological processes through the inflammation "drinking fuel" and thereby being extinguished, while corticosteroids suppress the immune system, thereby likewise extinguishing the inflammation, although the pathology in the affected area remains unchanged. That is why we recommend molecular hydrogen for all diseases for which Western medicine recommends the use of corticosteroids – the desired effect is achieved to an even greater extent, in addition to strengthening the potential of the organism.

Girl, 15 years old

Story: She had angina, treated with antibiotics. After discontinuation of therapy swelling in the limbs occurred, in full-height the circumference of the leg was also twice the normal size, hematoma. red locus (tissue necrosis) the limbs were very hot. the left knee was almost the size of a soccer ball. Pediatrician assessed the condition as a toxic reaction to bacteria, with the recommendation to "wait until passes". Increased difficulty with walking, the patient was completely immobile without the aid of crutches and assistance. After 2 weeks the mother contacted the doctor saying the condition had not improved, and she was advised hospitalization and use of corticosteroids, which the family refused. The girl started to use molecular hydrogen with a strict alkaline diet focused on the treatment of the internal environment, activation of the immune system and providing necessary minerals for the construction of the affected tissues and joint structures. After three weeks, the girl began to attend school again, the fact that her parents bring her there, but there was almost no swelling.

Commentary:

Here we see a situation where western medicine cannot deal with an unknown or serious problem differently than by its

decapitation – if waiting did not work and the mother of the girl was distressed – the doctor simply deployed corticosteroids, despite their toxic effects. It's even stranger on account of the fact that it is questionable whether it would even at all be justified by the indications. Nevertheless – after three weeks, the toxic and necrotic damaged tissue was healed enough so that the girl could begin returning to a normal life. Given the extent of the damage the length of time for regeneration is predictably longer.
