

Why Nutriveda For Therapeutic Use for Autism, Apraxia, Alzheimer's ADHD, Traumatic Brain Injury (TBI) and seizures? Etc.

Why would anyone use a product formulated for weight management in adults for children with ADD, ADHD, Autism, Alzheimer's, Apraxia, speech delays and impairments, Traumatic Brain Injury (TBI) and seizures? **The Answer- Because it works!**

There is a rapidly growing group of individuals of varied ages with special needs or various diagnoses having REMARKABLE IMPROVEMENTS on Zrli's NutriVeda **Achieve** over the past years.

Amy Backus shared that her family and marriage was strained for years due to the difficulty with their son Keaton who was diagnosed with ADHD. Doctors keep changing his meds as side effects became new problems. One day Amy discovered Zrli and let her son drink it. From that moment on their lives have changed, he is no longer on meds and peace is back in their family!

Amy Larson Backus

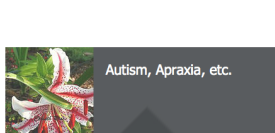

Just filled out Keaton's medication form for this year, (IBUPROFEN IF NEEDED!) If you are not a parent of an ADHD kid, you cannot understand the joy that comes with NOT having to have a stimulant medication sheet, signed by the MDDO, in original container, etc., etc. First year in 4 years I'm FREE!! And so is Keaton (see him in his Zrli Testimonial above)

God never ceases to amaze me. I think I know what I want, etc. and right out of the blue he gives me what I NEED. I have spent this entire year praising Him for everything He's given me, even when I thought I knew better. Who am I to ask for more when he's given me my son back? If you ever doubt "why," look up -- you may never know...but then again, you just might figure He will out!

My Child's Behavior Has Improved

I am a registered nurse, married and have two children with ADHD. My son is 10 and my daughter is 13. My daughter has had success with the medication she takes, but my son has always been up and down on dosages and has never truly benefited due to the side effects of the medicine: poor appetite, motor tics, poor fluid intake etc. We have tried almost every type of ADHD medication out there. He has been taking Zrli now for 3 weeks and we have noticed that it is calmer, eating better and sleeping better. We hope that the longer he drinks Zrli, symptoms will keep decreasing, hopefully being able to take him off the medication all together. We are very excited to share this experience and want to give people hope that Zrli can help their children too. This is one of the reasons I am so passionate about being able to share Zrli with friends, family and everyone across the globe!

Mia, Indiana

The following story was written by Lisa Geng, mother to two boys that were both "late talkers" who are doing great today. Due to this remarkable story she became the President and Founder of the Cherab Foundation, and Co Author of The Late Talker book St Martin's Press:

To preface, her son had Apraxia:

Apraxia, also known as dyspraxia, is a neurologically based motor planning disorder that affects a child's ability to be able to talk and/or coordinate fine/gross motor skills. While it is still relatively a less commonly known condition, it appears to be on the rise internationally for unknown reasons. It is frequently occurring in families with no genetic predisposition. Apraxia can exist alone as a speech issue, but apraxia commonly presents itself as a multifaceted condition with sensory integration dysfunction and/or hypotonic (low muscle tone).

As awareness about apraxia has increased in the autism community, it has come to light that a large number of children diagnosed with autism have underlying and undiagnosed apraxia, which affects their ability to speak. In fact, a small percentage of children have been misdiagnosed with autism but in fact, these children actually have just apraxia, which affects their ability to speak, not their ability to understand and use language.

In educational settings, many of these children are misclassified and placed in inappropriate disability-related classes when they could be mainstreamed if given the appropriate opportunity.

The following story was written by Lisa Geng, mother to two boys that were both "late talkers" who are doing great today. Due to this remarkable story she became the President and Founder of the Cherab Foundation, and Co Author of The Late Talker book St Martin's Press:

My son at 13 was considered a success, but there were issues. He was mainstreamed and I no longer had him in speech therapy even though he would once in a while see a therapist. He accepted how he spoke, and so did we. We accepted that he could communicate well enough to have friends, be in school mainstreamed without support, read the menu and order his own food at a restaurant. And we also knew that nobody would know Tanner had a speech issue if he kept his answers short; not unless he let his guard down and tried to talk in complex thoughts.

This is what my son was like as a year ago, what we accepted then:

1. Lags in both reading and writing. He was on level on both and tested to be above average in his concepts, but his expression was lagging. Reading out loud or writing was not enjoyable to him and I had to work with him with his homework. It was a struggle.
2. He didn't pick up abstract type humor if we were watching adult TV shows like say The Office. He was more literal; he enjoyed America's Funniest Home Videos for example.
3. He was also literal in his ability to listen. If a teacher said he had to do something like unplug unused appliances around the house to help save the planet- he would unplug appliances around our house and I asked him what he was doing he would say "Mom don't you care about planet Earth?" to the teacher said "OK, class after we are done I don't want anyone to leave until you help me clean up." Everyone would leave when they were done and I was told by a few very proud teachers that "He was the only one that helped me!" It was the strange parent that wasn't happy to hear that compliment. I knew he wasn't normal and wanted him to stay into abstract thought a bit more!
4. His ability in sports was clumsy but committed. Poor little guy would push himself until he was literally exhausted but his abilities were far short of other boys his age. He didn't run well, nor would you use the word effortless or graceful to describe him when he was playing sports. While his brother and all the other neighborhood kids were Heelys and used skate boards, Tanner would have his own but would never use them. His reflexes were sluggish as well.
5. He would tire easily and take naps when home from school.
6. Tanner never felt pain like others. He was called the "tough kid" when he got shot because he didn't cry, but he would say "ow" and cringe away if you kicked his arm, or patted his head. A few years ago he was at a sleep over and broke his finger playing football, but the family didn't know it was broken because he didn't tell them he hurt it. The next day when I went to pick him up he wanted to stay and swim, still not saying anything was wrong with his finger. The only reason I found out was because he couldn't "really bend it" anymore so I took him to the hospital where even when the doctor bashed where the break was he didn't flinch, but it was a broken finger. All these things we started to accept were who he was, and while I think any type of story of progress is great -- every rock is untamed if a new one pops up I think it's worth exploring. Then if that doesn't work you know that you helped your child get to as far as potentially possible.

For years I have had him on fish oils. Years ago few told them, but today many use fish oils and the essential fatty acids are known to be effective.

Then we discovered NutriVeda Achieve! We first introduced Tanner to Achieve for Weight loss which it what it was formulated for. Two days after starting Achieve, he lost 15 pounds. I'll never forget standing by the scale. I couldn't even talk because I was laughing saying "Tanner! You lost a pound and a half!" You have no idea how shocked we all were because Tanner had never lost weight. Five days later Tanner lost a total of SIX POUNDS!

It was surreal. Nobody believed it. People noticed that Tanner looked "thinner," "toned down," and "great." The results were not only visible to those who know him, but Tanner for the first time was thrilled. He not only lost weight, but he enjoyed the shakes and wasn't hungry! I was able to give him healthy light foods for lunch and, for the first time, Tanner didn't come home saying "you didn't give me enough lunch I am starving!" In addition even though Tanner was always tall for his age, within that few months he grew a few more inches. Tanner lost a total of 15 pounds and was now 148 and about 6 foot tall. My other son who is a poor eater didn't necessarily look skinny, but at 15 years old within the same few months he gained 17 pounds and grew about 2 inches and went from 5 foot 10 to about 6 foot six now. My boys were now taller than both mom and dad!

But there is more incredible news to report... Tanner's speech became smoother and faster than ever which is not only incredible, but extremely intriguing. It raised the question of whether Achieve is somehow helping with Tanner's metabolic functioning. Yes, it clearly is! It was about a week after Tanner started the Achieve that we all started to notice his speech getting better. Quite honestly we were all so focused on the six pound weight loss, our main focus. Clearly his speech had improved. Another week went by and Tanner lost another two pounds for a total of eight one pound weight loss in two weeks. As good as that news was, there was the fact that Achieve appeared to be in such high demand that I was on backorder. I had to ask Tanner's Achieve book substantially in fear of running out prior to getting more in. He was upset as well saying to me "Mommy why did you have to tell everyone about it?" He thought it was because of me that this huge company had a backorder!

But something interesting happened; about a days into the greatly reduced dosage Tanner's speech regressed back. I asked him what was going on with his speech and he answered "I don't know I'm just all bumpy again." The only thing I could think of was the Achieve. The next day I gave him once again a full dosage and sure enough his speech was better. In addition to weight loss and speech improvements in the weeks that followed we've noticed the following side benefits which are all out of character for Tanner prior: waking up each morning prior to his alarm, greater interest in reading and sharing the books he is reading (in detail), reading a chapter book in two days, sudden ability to independently drink one cup of a drink in a line, being regular daily, I spoke with the head of Tanner's school who confirmed that at school they too are noticing a changed student all of a sudden. I'm told about how he is walking the halls with his head in a book reading. That after lunch prior to Achieve Tanner would seem "wiped out" and that now he's "alert" with "improved speech" and "participating more in class".

It's now been a few months on the Achieve and there are many others seeing the same surges in their children (of all ages from 2 years old to teens and adults) with diagnosis of apraxia, autism, TBI, global delays, ADHD. The following is a list of the areas we are seeing surges in, and in almost all cases within 3 to 5 days:

- SPEECH articulation, complexity and sophistication of sentence structure
- LANGUAGE better understanding of written and spoken word, development of better reading and writing skills
- ACADEMICS/LEARNING reported surges in all areas of school. For preschool age sudden awareness of numbers, letters, even spelling
- FINE AND GROSS MOTOR SKILLS improvements in various activities reported including riding a bike, swimming to bathroom pants
- POTTY TRAINING and bed wetting resolved for those of all ages who had issues are reported
- SENSE OF HUMOR both catching subtle humor/abstract humor, and wanting to make others laugh-poking around
- AWARENESS OF SURROUNDINGS for autism reported following gaze and more interactions
- FACIAL EXPRESSIONS more non-verbal communication, for oral apraxia more expressions instead of blank stares when not engaged in conversation
- FOCUS on task, more willing to listen and try
- MULTI TASKING for those with motor planning impairments such as apraxia as this is something typically not done or done well prior to NV
- SOCIAL wanting to participate with others via play and communication
- MOOD reported seems "happier" for a number
- BEHAVIOR normalization reported in a few cases of those with severe behavioral issues of head banging, hitting, biting, aggression and anger issues
- MUSIC increased interest in listening to, humming or singing music
- DEVELOPMENTAL CATCHING UP for those that never went through stages -reportedly going through them for the first time.
- DECREASE IN SEIZURES so far in several cases elimination of any seizures and headaches and decrease in elimination in seizure meds as well
- IMAGINATIVE PLAY increase in imaginative play and story telling
- IMPROVED DIET willingness to try more foods for those that were "picky eaters" prior within 1 month or more.
- SENSORY improvement in sensory awareness for those affected with sensory integration dysfunction
- GROWTH reported dramatic surges in height as well as increase in muscle and normalization in weight
- REFLEXES normalization of reflexes for those who had poor reflexes

My son has had within the one year on Achieve, surges across the board that are SO profound that every single person that meets him now that knew him just 18 months ago is SHOCKED.

He quickly on Achieve developed a tremendous surge in complex language, independence and excellence in academics, grace and abilities in sports in basketball, football to the point if you didn't know it was him you'd never know it was him on that field, quick reflexes, fully developed mature abstract sense of humor that he both understands it he hears it and knowledge in how to make others laugh in his own, passion for music, interest in current events and wanting to discuss them, tremendous growth from a stocky 5 foot 11 slightly overweight child who had been on a healthy organic diet but was that way regardless to a muscular SIX FOOT ONE 14 year old. And cherry on top he was recommended for honors classes for high school and of all things honors English too. He just gave a verbal report in school and got an A and he just wrote to NCAA the other day.

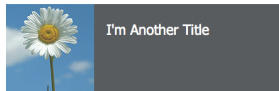

"I'm not in speech therapy. I gave a verbal report today and the teacher wrote down that I was nice and loud and with a clear voice. Sometimes I am tired my speech messes up."

What has amazed me is the number of kids older than my son in that group who are still impaired in speech, still having trouble being understood at times. How many are teased. And so far none have ever used fish oils (or in my case Achieve as that's so new).

Zrli's NutriVeda Achieve has resulted in improvements that are far more effective than any drugs or treatments on the market for conditions ranging from autism, seizure, Alzheimer's, Parkinson's and Epilepsy. These positive effects are not limited to any specific age groups, with results seen in ages ranging from toddlers through to seniors. For example, we have numerous reports of individuals coming off various medications for seizures due to Achieve, only to have their seizures return when these same people stop taking the original Achieve.

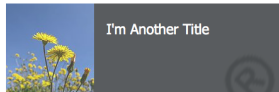

Fast forward a year where there are close to a thousand families that have their children and families taking Achieve for health and therapeutic benefits. Reports from parents as well as professional anecdotal feedback speak to the fact that the essential nutrients in Achieve prove to be helping the body to help itself.

We have come so far in knowledge as to why Achieve is so effective as well as the tremendous amount of dramatic surges for various conditions and various ages. I am not yet suggesting that the results Tanner is having are typical, but based upon the feedback from our group who also started their children on Achieve it appears to be so, and for the majority - again within days.
