Agel UMI - it is a unique product containing fucoidan alive - one of the most spectacular discoveries in recent times. In the mid 80s the World Health Association (WHO) did demographic research worldwide. The highest life expectancy was recorded in Japan, Okinawa Prefecture - its residents live on average 85 years old. The secret of longevity lies in the fact that the inhabitants of the coastal islands are eaten raw kelp containing fucoidan. After numerous studies, scientists demonstrated a wide range of useful properties of fucoidan, including cancer prevention. More than 10,000 scientific studies done in the study of fucoidan. You can see this in person, by typing "fucoidan" in search engines Yandex and Google. Among the many promotional websites, pay attention to the documents in format .pdf - they contain the reports and the results of research conducted around the world.

The main advantage over other Agel UMI Fucoidan is the product contained live content fucoidan without heat treatment. This was made possible thanks to suspension gel technology ("Gelceuticals"), which retains all the natural molecular bonds of this fragile polysaccharide and does not involve heating or drying. The fact is that when heated to 60 degrees and dried fucoidan, its effectiveness is significantly reduced.

The scientific team Agel has developed a technology that preserves the nutrients in the living vied ensures their bioavailability to 98-99%, which is 4 times the bioavailability of tablets and capsules.

Effect of admission UMI

Strong support immunity.

Cleansing the lymphatic system.

The strong antioxidant effect.

The regeneration of stem cells.

Life energy.

Natural source of iodine.

Victory over allergies.

Prevention of cancer.

Contains 77 natural trace elements.

How does this product?

Fucoidan actively interacts with the immune system and regulates its operation, i.e., is immunoregulator. This means that it enhances the immune system, when it is depressed, for example: chronic fatigue, as well as reduces it when it is over-stimulated, such as lupus or chronic arthritis. Fucoidan helps balance the immune system

Immunomodulatory effects of fucoidan

Activated primary strength of the immune response. The result of the penetration of fucoidan in the stem cell nucleus is the launch of the reproductive process, the outcome of which - the formation of new healthy cells of the immune system. The number of macrophages, B and T lymphocytes and NK-cells (natural killer cells) present in the blood increases.

Stem cell - is a fundamental principle of the bone, liver, and other organs. Activating the process of reproduction of stem cells, fucoidan helps as a significant increase immune response and tissue repair organs - the liver and other.

Enhanced degree of activity of substances that deplete the foreign microorganisms. When injected into the human body bacteria, fucoidan runs a program of destruction. Mononuclear phagocytes (macrophages) captured bacteria and other harmful particles. Using enzymes contained in their lysosomes (intracellular structures) microorganism malicious "dissolve". With fucoidan significantly enhanced the activity of these enzymes, resulting in the mobilization of immune protection.

Goes fast process of protein synthesis, destroying pathogens (interleukin-1, interferon-gamma). The response to the penetration of harmful microorganisms is the release by immune cells in the blood of specific substances which can be fixed on the surface and destroy the pathogen. Fucoidan activates the synthesis of interleukin-1 and gamma-interferon, resulting in increased ability of the organism to the immune response.

Increases the number of antibodies. The cells that make up the immune system, have the ability to produce antibodies - special substances, which in the case of a new pathogen intrusion attempts to immediately detect it and attach to the surface on a "lock and key". As a result, the object becomes visible for killer cells. Fucoidan helps enhance antibody production, resulting in a secondary immune response is improved, and the disease is rapidly recedes.

Fucoidan activates the compliment, interacts between congenital (hereditary) and acquired types of immunity.
