CANCER AND THE NO FACTOR
Nitric Oxide appears to be one of the most powerful allies as the body mobilizes for war against this life-threatening cellular disorder. NO can inhibit the growth of cancer cells --- not only in the earliest stages when there may be only a few undetected cells, but also later in the disease process. High levels of NO may be able to slow cancer cell proliferation, keeping the cancer in a holding pattern long enough for the body's own immune system to prepare to destroy malignant cells on its own. Some researchers have theorized that one of the most important functions of NO is to prevent the onset of various cancers by inhibiting abnormal cell growth. Dr. Louis J. Ignarro "NO MORE HEART DISEASE " page 196 - 197
