Lunasin and breast cancer metastasis

This recent study from China provides a mechanism to elucidate how lunasin can inhibit the metastasis (migration and invasion) of breast cancer cells. The researchers have shown that lunasin inhibits the expression of genes involved in cancer metastasis and inflammation pathway by the competitive binding of the RGD (arginine-glycine-aspartic acid) tri-peptide motif in lunasin to integrin receptors in breast cancer cells. Although promising, the results from this cell culture (in vitro) study need to be validated first in mice cancer models before any human clinical trials on effect of lunasin on breast cancer metastasis can be conducted.

- Dr Alfredo Galvez

Did you know? LunaRichX capsules are made from non-GMO soy, is the most pure, concentrated form of lunasin ever produced — and available only from Reliv.
