## **"Coincidence? I don't think so."**

Arthur and Barbara Gill | ANNAPOLIS, MD

*"About six months prior to the introduction of Nutraview, I was diagnosed with early stages eye problems. At Convention when I saw what the science was behind Nutraview, I began taking right there. I continued taking it daily until my next eye doctor appointment a little over a year later. The same doctor did the exam. She took an unusual amount of time, and ran the tests for all three conditions multiple times. Needless to say, I was worried. When she finished, I asked her, "what's the bad news? You kept testing and making notes." She responded, "Yes, I did because I thought I had your records mixed up with another patient as I could find no evidence of the conditions from last year's exam with the exception of minor eye symptoms. But that has not progressed since your last exam. In fact, it may be even a little less." Insert happy face here. "So, that's good news?" I said. "Yes, and very unusual.", she replied. Also, you'll need to get new glasses because your prescription has changed significantly. But you'll be happy because your glasses will be much thinner since your eyesight is much better." I of course tried to explain why my vision had improved and even dropped off some info on Nutraview but I suspect she never looked at it. Every exam since then my vision has incrementally improved and my glasses (which I've worn since age 8) have continued to get thinner. Thanks Melaleuca! "*
